the noise level will increase.)

 Units are tested in accordance with IEST RP-CC002.2, Recommended Practice for Unidirectional Flow Clean-Air Devices.
 Sound levels were measured with unit installed in a T-Bar ceiling, with gasket, in a

standard room. Sound levels in dBA were measured at a distance of 30 inches from

the filter face, with the unit set to produce 90 fpm average face velocity. (Note that

data is for a clean filter only. If fan speed is increased to compensate for filter loading

- For electrical circuit sizing, consult the "max amps" shown on the submittal for each product configuration and voltage.
 All data is based on a unit with a clean HEPA filter.
- So fpm values are based on active filter area.
- 6. Heat Gain: BTUh = Watts x 3.413
